MANUAL TÉCNICO

Información del sistema:

OS: Ubuntu 22.04.2 LTS

• • OS Type: 64-bit

• • CPU: Intel core i5 2.50 GHz

• • GPU: Mesa Intel HD Graphics 4400

• Versión de java: 17

• • RAM: 8 GB

• IDE: IntelliJ idea

• Control de versiones: git 2.34.1

• Github: https://github.com/Hatsune02/CaptchaForge.git

Descripción del Proyecto

Este proyecto consiste en una aplicación web desarrollada para la creación y evaluación de captchas embebidos, diseñada para un entorno seguro y flexible que permite a los usuarios generar captchas personalizados utilizando scripting. La arquitectura se basa en una combinación de frontend en Angular, una API en Java, y dos parsers especializados, uno para procesar el lenguaje embebido de captchas en el lado del servidor y otro para el procesamiento de expresiones en el frontend.

Tecnologías Utilizadas

1. Angular

Descripción: Angular es un framework de desarrollo frontend basado en TypeScript, que facilita la creación de aplicaciones de una sola página (SPA). Ofrece un sistema de componentes modular, lo que permite crear interfaces de usuario dinámicas y estructuradas. Además, Angular proporciona herramientas como su sistema de enrutamiento y servicios HTTP, que se utilizan para la comunicación con la API de backend.

Rol en el Proyecto: En este proyecto, Angular se encarga de la interfaz de usuario y permite a los usuarios interactuar de manera intuitiva con el sistema de captchas embebidos. Angular también se encarga de hacer llamadas a la API para obtener datos, enviar información, y actualizar la UI en tiempo real sin necesidad de recargar la página.

2. Java (API RESTful)

Descripción: Java es un lenguaje de programación de propósito general que ofrece robustez, seguridad y escalabilidad. Para este proyecto, Java se utilizó junto con un framework de desarrollo de API RESTful (como Spring Boot o JAX-RS) para crear el backend.

Rol en el Proyecto: La API desarrollada en Java es responsable de gestionar toda la lógica de negocio y la interacción con la base de datos. La API recibe solicitudes desde el frontend, valida y procesa la información, y devuelve las respuestas adecuadas. También gestiona el parser de captchas embebidos, que valida y evalúa el código escrito por los usuarios, y proporciona respuestas personalizadas.

3. Parser en JFlex y CUP

Descripción: JFlex y CUP son herramientas en Java para construir analizadores léxicos y sintácticos. JFlex se encarga del análisis léxico, generando un analizador que identifica y clasifica las cadenas de entrada, mientras que CUP (Constructor de Parsers para Universidades) crea un analizador sintáctico que interpreta las expresiones de acuerdo con una gramática definida.

Rol en el Proyecto: Este parser fue desarrollado para interpretar y validar el lenguaje embebido de captchas en el servidor. Se utiliza para evaluar el scripting en los captchas, verificando la sintaxis y las operaciones lógicas y matemáticas. Con JFlex y CUP, el servidor puede procesar y ejecutar el código de captchas de manera segura, permitiendo un flujo de trabajo dinámico y ajustado a los requisitos del proyecto.

4. Parser en Jison

Descripción: Jison es una herramienta de JavaScript que permite crear analizadores léxicos y sintácticos similares a Bison (una herramienta para C/C++). Jison es ampliamente utilizado para interpretar expresiones dentro de aplicaciones frontend y es compatible con el ecosistema de JavaScript.

Rol en el Proyecto: En el frontend, Jison se encarga del análisis de expresiones para evaluar y validar las entradas de usuario. Al integrar un parser con Jison en Angular, el sistema puede analizar las expresiones en tiempo real y dar retroalimentación inmediata, mejorando la experiencia de usuario y evitando errores de interpretación.
